

# Configuring an IP in MacOS X

Follow these steps to configure an IP in Mac OS X

1. Open the system preferences from the Apple menu in the top left corner of the screen.
2. Change to the Network tab option at the top of the window
3. Make sure Built-In Ethernet is selected from the drop down list
4. Change the configure drop down list to Manually
5. Enter your IP address and Subnet Mask in the boxes provided
6. Fill in any DNS servers in the box on the right. Use the servers in the picture below or 4.2.2.2
7. Click apply now to change to your new IP address

See the picture below for reference to the proper layout of the network options
